Abstract

In this set of notes we do the following.

- **denominator graphs:**

- Intra-loop modelling - ability to model within loop level
- Modelling higher-loop based on previous loop order
- Shap value analysis - what is the driving the decision

- **f-graphs**

1 Motivation

2 Features

This section provides a comprehensive overview of all graph features used in our analysis. The features are extracted using two main tools: `fgraph_features_cli2.py` for comprehensive graph analysis and `motif_features_cli.py` for motif-specific features.

2.1 Feature Categories

The features are organized into the following categories:

- **Basic:** Fundamental graph properties (nodes, edges, degrees, density, clustering)
- **Connectivity:** Path-based metrics (diameter, radius, shortest paths, components)
- **Centrality:** Node importance measures (betweenness, closeness, eigenvector)
- **Core:** K-core decomposition metrics
- **Robustness:** Vulnerability measures (articulation points, bridges)
- **Cycles:** Cycle counting features
- **Spectral_Laplacian:** Laplacian matrix eigenvalues and related metrics
- **NetLSD:** Network Laplacian Spectral Descriptor features
- **Planarity:** Planar embedding properties
- **Symmetry:** Graph automorphism features
- **Community:** Community detection metrics
- **Motifs_3_4:** 3-node and 4-node motif counts
- **Motifs_5:** 5-node motif counts
- **Motifs_4:** 4-node induced subgraph counts

- **Spectral_Adjacency**: Adjacency matrix spectrum features
- **TDA**: Topological Data Analysis features (persistent homology)
- **Normalized variants**: Size-normalized versions of many features

A complete list of all 179 features with their descriptions and interpretations can be found in Appendix A.

3 Intra-loop modelling

3.1 Feature reduction

4 Predicting l from $p < l$ loop orders

4.1 Approach 1: Timeseries approach

4.1.1 Feature reduction

4.1.2 Shap Analysis

4.2 Approach 2: General l learning

4.2.1 Feature reduction

4.2.2 Shap Analysis

4.3 Ensemble learning

A Complete Feature Descriptions

This appendix provides a comprehensive list of all \mathcal{F} graph features with their descriptions and interpretations. Due to the large number of features, the table is split across multiple pages for readability.

Feature Name	Group	Description	Interpretation
<code>Basic.num.nodes</code>	Basic	<i>Total number of nodes in the graph</i>	The larger this number the bigger the graph is
<code>Basic.num.edges</code>	Basic	<i>Total number of edges in the graph</i>	The larger this number the more connected the graph is
<code>Basic.min.degree</code>	Basic	<i>Minimum degree among all nodes</i>	The larger this number the more connected the least connected node is
<code>Basic.max.degree</code>	Basic	<i>Maximum degree among all nodes</i>	The larger this number the more connected the most connected node is
<code>Basic.avg.degree</code>	Basic	<i>Average degree across all nodes</i>	The larger this number the more connected the graph is on average
<code>Basic.degree.std</code>	Basic	<i>Standard deviation of node degrees</i>	The larger this number the more unequal the node connections are
<code>Basic.degree.skew</code>	Basic	<i>Skewness of degree distribution</i>	Positive values mean more high-degree nodes; negative means more low-degree nodes
<code>Basic.density</code>	Basic	<i>Graph density (edges/max.possible.edges)</i>	The larger this number the more densely connected the graph is
<code>Basic.edge_to_node_ratio</code>	Basic	<i>Ratio of edges to nodes</i>	The larger this number the more edges per node the graph has
<code>Basic.degree_entropy</code>	Basic	<i>Shannon entropy of degree distribution</i>	The larger this number the more diverse the node degrees are
<code>Assortativity.degree</code>	Basic	<i>Degree assortativity coefficient</i>	Positive values mean similar-degree nodes connect; negative means opposite-degree nodes connect
<code>Clustering.mean</code>	Basic	<i>Average local clustering coefficient</i>	The larger this number the more clustered/triangular the graph is
<code>Clustering.q10</code>	Basic	<i>10th percentile of clustering coefficients</i>	The larger this number the more clustered the least clustered nodes are
<code>Clustering.q50</code>	Basic	<i>50th percentile (median) of clustering coefficients</i>	The larger this number the more clustered the typical node is
<code>Clustering.q90</code>	Basic	<i>90th percentile of clustering coefficients</i>	The larger this number the more clustered the most clustered nodes are
<code>Clustering.frac_zero</code>	Basic	<i>Fraction of nodes with zero clustering</i>	The larger this number the more tree-like the graph is
<code>Clustering.frac_one</code>	Basic	<i>Fraction of nodes with clustering = 1</i>	The larger this number the more clique-like the graph is
<code>Degree.gini</code>	Basic	<i>Gini coefficient of degree distribution</i>	The larger this number the more unequal the node degrees are

Feature Name	Group	Description	Interpretation
<code>Connectivity.is_connected</code>	Connectivity	<i>Whether graph is connected (True/False)</i>	True means all nodes can reach each other; False means graph is fragmented
<code>Connectivity.num_components</code>	Connectivity	<i>Number of connected components</i>	The larger this number the more fragmented the graph is
<code>Connectivity.diameter</code>	Connectivity	<i>Graph diameter (longest shortest path)</i>	The larger this number the more spread out the graph is
<code>Connectivity.radius</code>	Connectivity	<i>Graph radius (minimum eccentricity)</i>	The larger this number the more spread out the graph is
<code>Connectivity.avg_shortest_pathLength</code>	Connectivity	<i>Average shortest path length</i>	The larger this number the more spread out the graph is
<code>Connectivity.wiener_index</code>	Connectivity	<i>Sum of all shortest path lengths</i>	The larger this number the more spread out the graph is
<code>Eff.diameter.p90</code>	Connectivity	<i>90th percentile effective diameter</i>	The larger this number the more spread out the graph is
<code>Ecc.mean</code>	Connectivity	<i>Mean eccentricity of nodes</i>	The larger this number the more spread out the graph is
<code>Ecc.q90</code>	Connectivity	<i>90th percentile eccentricity</i>	The larger this number the more spread out the graph is
<code>Centrality.betweenness_mean</code>	Centrality	<i>Mean betweenness centrality</i>	The larger this number the more nodes act as bridges/connectors
<code>Centrality.betweenness_max</code>	Centrality	<i>Maximum betweenness centrality</i>	The larger this number the more important the most central node is
<code>Centrality.betweenness_std</code>	Centrality	<i>Standard deviation of betweenness centrality</i>	The larger this number the more unequal the node importance is
<code>Centrality.betweenness_skew</code>	Centrality	<i>Skewness of betweenness centrality distribution</i>	Positive values mean few very important nodes; negative means many moderately important nodes
<code>Centrality.closeness_mean</code>	Centrality	<i>Mean closeness centrality</i>	The larger this number the more centrally located nodes are on average
<code>Centrality.closeness_max</code>	Centrality	<i>Maximum closeness centrality</i>	The larger this number the more centrally located the most central node is
<code>Centrality.closeness_std</code>	Centrality	<i>Standard deviation of closeness centrality</i>	The larger this number the more unequal the node centrality is
<code>Centrality.closeness_skew</code>	Centrality	<i>Skewness of closeness centrality distribution</i>	Positive values mean few very central nodes; negative means many moderately central nodes
<code>Centrality.eigenvector_mean</code>	Centrality	<i>Mean eigenvector centrality</i>	The larger this number the more nodes are connected to important nodes
<code>Centrality.eigenvector_max</code>	Centrality	<i>Maximum eigenvector centrality</i>	The larger this number the more important the most influential node is
<code>Centrality.eigenvector_std</code>	Centrality	<i>Standard deviation of eigenvector centrality</i>	The larger this number the more unequal the node influence is

Feature Name	Group	Description	Interpretation
Centrality.eigenvector_skew	Centrality	<i>Skewness of eigenvector centrality distribution</i>	Positive values mean few very influential nodes; negative means many moderately influential nodes
Core.max_core_index	Core	<i>Maximum k-core index</i>	The larger this number the more tightly connected the densest core is
Core.core_index_mean	Core	<i>Mean k-core index</i>	The larger this number the more tightly connected nodes are on average
Robust.articulation_points	Robustness	<i>Number of articulation points (cut vertices)</i>	The larger this number the more vulnerable the graph is to fragmentation
Robust.bridge_count	Robustness	<i>Number of bridges (cut edges)</i>	The larger this number the more vulnerable the graph is to fragmentation
Cycle.num_cycles_len_5	Cycles	<i>Number of cycles of length 5</i>	The larger this number the more 5-cycles the graph contains
Cycle.num_cycles_len_6	Cycles	<i>Number of cycles of length 6</i>	The larger this number the more 6-cycles the graph contains
Spectral.algebraic_connectivity	Spectral.Laplacian	<i>Second smallest Laplacian eigenvalue (Fiedler value)</i>	The larger this number the more connected the graph is
Spectral.spectral_gap	Spectral.Laplacian	<i>Difference between first two Laplacian eigenvalues</i>	The larger this number the more well-connected the graph is
Spectral.laplacian_mean	Spectral.Laplacian	<i>Mean of Laplacian eigenvalues</i>	The larger this number the more connected the graph is on average
Spectral.laplacian_std	Spectral.Laplacian	<i>Standard deviation of Laplacian eigenvalues</i>	The larger this number the more varied the connectivity patterns are
Spectral.laplacian_skew	Spectral.Laplacian	<i>Skewness of Laplacian eigenvalue distribution</i>	Positive values mean few highly connected components; negative means many moderately connected components
Spectral.lap_eig_0	Spectral.Laplacian	<i>Smallest Laplacian eigenvalue</i>	Always 0 for connected graphs; larger values indicate more disconnected components
Spectral.lap_eig_1	Spectral.Laplacian	<i>Second smallest Laplacian eigenvalue</i>	The larger this number the more connected the graph is
Spectral.lap_eig_2	Spectral.Laplacian	<i>Third smallest Laplacian eigenvalue</i>	The larger this number the more connected the graph is
Spectral.lap_eig_3	Spectral.Laplacian	<i>Fourth smallest Laplacian eigenvalue</i>	The larger this number the more connected the graph is
Spectral.lap_eig_4	Spectral.Laplacian	<i>Fifth smallest Laplacian eigenvalue</i>	The larger this number the more connected the graph is
Spectral.lap_eig_5	Spectral.Laplacian	<i>Sixth smallest Laplacian eigenvalue</i>	The larger this number the more connected the graph is
Spectral.lap_eig_6	Spectral.Laplacian	<i>Seventh smallest Laplacian eigenvalue</i>	The larger this number the more connected the graph is
Spectral.lap_eig_7	Spectral.Laplacian	<i>Eighth smallest Laplacian eigenvalue</i>	The larger this number the more connected the graph is

Feature Name	Group	Description	Interpretation
Spectral.lap.eig.8	Spectral.Laplacian	<i>Ninth smallest Laplacian eigenvalue</i>	The larger this number the more connected the graph is
Spectral.lap.eig.9	Spectral.Laplacian	<i>Tenth smallest Laplacian eigenvalue</i>	The larger this number the more connected the graph is
Kirchhoff.index	Spectral.Laplacian	<i>Kirchhoff index (sum of resistance distances)</i>	The larger this number the more spread out the graph is
NetLSD_mean	NetLSD	<i>Mean NetLSD signature</i>	The larger this number the more complex the graph structure is
NetLSD_std	NetLSD	<i>Standard deviation of NetLSD signature</i>	The larger this number the more varied the graph structure is
NetLSD_q10	NetLSD	<i>10th percentile of NetLSD signature</i>	The larger this number the more complex the simplest parts are
NetLSD_q90	NetLSD	<i>90th percentile of NetLSD signature</i>	The larger this number the more complex the most complex parts are
Planarity_num_faces	Planarity	<i>Number of faces in planar embedding</i>	The larger this number the more complex the planar structure is
Planarity_face_size_mean	Planarity	<i>Mean face size in planar embedding</i>	The larger this number the larger the typical face is
Planarity_face_size_max	Planarity	<i>Maximum face size in planar embedding</i>	The larger this number the larger the biggest face is
Symmetry_automorphism_group_order	Symmetry	<i>Order of automorphism group</i>	The larger this number the more symmetric the graph is
Symmetry_num_orbits	Symmetry	<i>Number of node orbits under automorphisms</i>	The larger this number the more diverse the node roles are
Symmetry_orbit_size_max	Symmetry	<i>Maximum orbit size</i>	The larger this number the more nodes share the same role
Comm_modularity	Community	<i>Modularity of best community partition</i>	The larger this number the more clearly separated the communities are
Comm_count	Community	<i>Number of communities found</i>	The larger this number the more fragmented the graph is
Comm_size_max	Community	<i>Size of largest community</i>	The larger this number the more dominant the largest community is
Comm_size_gini	Community	<i>Gini coefficient of community sizes</i>	The larger this number the more unequal the community sizes are
Comm_internal_edge_frac	Community	<i>Fraction of edges within communities</i>	The larger this number the more internally connected communities are
Motif_triangles	Motifs_3_4	<i>Number of triangles (3-cliques)</i>	The larger this number the more triangular structures the graph has
Motif_wedges	Motifs_3_4	<i>Number of wedges (2-paths)</i>	The larger this number the more path-like structures the graph has

Feature Name	Group	Description	Interpretation
Motif_4_cycles	Motifs_3_4	<i>Number of 4-cycles</i>	The larger this number the more square-like structures the graph has
Motif_4_cliques	Motifs_3_4	<i>Number of 4-cliques (K_4)</i>	The larger this number the more tightly connected 4-node groups the graph has
Motif_triangle.edge.incidence.mean	Motifs_3_4	<i>Mean triangles per edge</i>	The larger this number the more triangles each edge participates in
Motif_triangle.edge.incidence.std	Motifs_3_4	<i>Standard deviation of triangles per edge</i>	The larger this number the more varied edge participation in triangles is
Motif_square.clustering-proxy	Motifs_3_4	<i>Tendency to form 4-cycles relative to 2-paths</i>	The larger this number the more square-like the graph structure is
Motif_triangle.edge.incidence.median	Motifs_3_4	<i>Median triangles per edge</i>	The larger this number the more triangles the typical edge participates in
Motif_triangle.edge.incidence.q90	Motifs_3_4	<i>90th percentile triangles per edge</i>	The larger this number the more triangles the most triangular edges participate in
Motif_triangle.edge.frac.zero	Motifs_3_4	<i>Fraction of edges with zero triangles</i>	The larger this number the more tree-like the graph is
Motif_triangle.edge.frac.ge2	Motifs_3_4	<i>Fraction of edges with ≥ 2 triangles</i>	The larger this number the more clustered the graph is
Motif_induced_K1_3	Motifs_3_4	<i>Number of induced $K_{1,3}$ (star) subgraphs</i>	The larger this number the more star-like structures the graph has
Motif_induced_P4	Motifs_3_4	<i>Number of induced P_4 (path) subgraphs</i>	The larger this number the more path-like structures the graph has
Motif_induced_C4	Motifs_3_4	<i>Number of induced C_4 (cycle) subgraphs</i>	The larger this number the more cycle-like structures the graph has
Motif_induced_TailedTriangle	Motifs_3_4	<i>Number of induced tailed triangle subgraphs</i>	The larger this number the more tailed triangle structures the graph has
Motif_induced_Diamond	Motifs_3_4	<i>Number of induced diamond subgraphs</i>	The larger this number the more diamond structures the graph has
Motif_induced_K4	Motifs_3_4	<i>Number of induced K_4 (clique) subgraphs</i>	The larger this number the more tightly connected 4-node groups the graph has
Motif_induced_connected_per_4	Motifs_3_4	<i>Fraction of 4-node subsets that are connected</i>	The larger this number the more connected 4-node groups are
Motif_5_cycles	Motifs_5	<i>Number of 5-cycles</i>	The larger this number the more 5-sided cycle structures the graph has
Motif_5_cliques	Motifs_5	<i>Number of 5-cliques (K_5)</i>	The larger this number the more tightly connected 5-node groups the graph has
Motif_induced5_g_0_5	Motifs_5	<i>Number of induced 5-node graphlet g_0</i>	The larger this number the more g_0 structures the graph has
Motif_induced5_g_1_5	Motifs_5	<i>Number of induced 5-node graphlet g_1</i>	The larger this number the more g_1 structures the graph has

Feature Name	Group	Description	Interpretation
Motif_induced5_g_2_5	Motifs_5	Number of induced 5-node graphlet g_2	The larger this number the more g_2 structures the graph has
Motif_induced5_g_3_5	Motifs_5	Number of induced 5-node graphlet g_3	The larger this number the more g_3 structures the graph has
Motif_induced5_g_4_5	Motifs_5	Number of induced 5-node graphlet g_4	The larger this number the more g_4 structures the graph has
Motif_induced5_g_5_5	Motifs_5	Number of induced 5-node graphlet g_5	The larger this number the more g_5 structures the graph has
Motif_induced5_g_6_5	Motifs_5	Number of induced 5-node graphlet g_6	The larger this number the more g_6 structures the graph has
Motif_induced5_g_7_5	Motifs_5	Number of induced 5-node graphlet g_7	The larger this number the more g_7 structures the graph has
Motif_induced5_g_8_5	Motifs_5	Number of induced 5-node graphlet g_8	The larger this number the more g_8 structures the graph has
Motif_induced5_g_9_5	Motifs_5	Number of induced 5-node graphlet g_9	The larger this number the more g_9 structures the graph has
Motif_induced5_g_10_5	Motifs_5	Number of induced 5-node graphlet g_10	The larger this number the more g_10 structures the graph has
Motif_induced5_g_11_5	Motifs_5	Number of induced 5-node graphlet g_11	The larger this number the more g_11 structures the graph has
Motif_induced5_g_12_5	Motifs_5	Number of induced 5-node graphlet g_12	The larger this number the more g_12 structures the graph has
Motif_induced5_g_13_5	Motifs_5	Number of induced 5-node graphlet g_13	The larger this number the more g_13 structures the graph has
Motif_induced5_g_14_5	Motifs_5	Number of induced 5-node graphlet g_14	The larger this number the more g_14 structures the graph has
Motif_induced5_g_15_5	Motifs_5	Number of induced 5-node graphlet g_15	The larger this number the more g_15 structures the graph has
Motif_induced5_g_16_5	Motifs_5	Number of induced 5-node graphlet g_16	The larger this number the more g_16 structures the graph has
Motif_induced5_g_17_5	Motifs_5	Number of induced 5-node graphlet g_17	The larger this number the more g_17 structures the graph has
Motif_induced5_g_18_5	Motifs_5	Number of induced 5-node graphlet g_18	The larger this number the more g_18 structures the graph has
Motif_induced5_g_20_5	Motifs_5	Number of induced 5-node graphlet g_20	The larger this number the more g_20 structures the graph has
Motif.induced.connected.per_5	Motifs_5	Fraction of 5-node subsets that are connected	The larger this number the more connected 5-node groups are
Adjacency.energy	Spectral_Adjacency	Sum of absolute eigenvalues of adjacency matrix	The larger this number the more energetic/vibrant the graph is

Feature Name	Group	Description	Interpretation
Adjacency.estrada.index	Spectral_Adjacency	<i>Sum of exponentials of eigenvalues</i>	The larger this number the more communicable the graph is
Adjacency.moment.2	Spectral_Adjacency	<i>Second moment of adjacency eigenvalues</i>	The larger this number the more spread out the adjacency spectrum is
Adjacency.moment.3	Spectral_Adjacency	<i>Third moment of adjacency eigenvalues</i>	Positive values mean more high-frequency components; negative means more low-frequency components
Adjacency.moment.4	Spectral_Adjacency	<i>Fourth moment of adjacency eigenvalues</i>	The larger this number the more peaked the adjacency spectrum is
Spectral.laplacian_heat_trace.t0	Spectral_Laplacian	<i>Laplacian heat trace at t=0.1</i>	The larger this number the more heat spreads quickly through the graph
Spectral.laplacian_heat_trace.t5	Spectral_Laplacian	<i>Laplacian heat trace at t=1.0</i>	The larger this number the more heat spreads through the graph
Spectral.laplacian_heat_trace.t50	Spectral_Laplacian	<i>Laplacian heat trace at t=5.0</i>	The larger this number the more heat spreads through the graph
TDA_H0_count	TDA	<i>Number of H0 homology features (connected components)</i>	The larger this number the more disconnected components the graph has
TDA_H0_total_persistence	TDA	<i>Total persistence of H0 features</i>	The larger this number the more persistent the connectivity structure is
TDA_H0_mean_persistence	TDA	<i>Mean persistence of H0 features</i>	The larger this number the more stable the connectivity structure is
TDA_H0_max_persistence	TDA	<i>Maximum persistence of H0 features</i>	The larger this number the more stable the most persistent component is
TDA_H0_persistence_entropy	TDA	<i>Entropy of H0 persistence distribution</i>	The larger this number the more diverse the persistence values are
TDA_H0_mean_birth	TDA	<i>Mean birth time of H0 features</i>	The larger this number the later components typically appear
TDA_H0_mean_death	TDA	<i>Mean death time of H0 features</i>	The larger this number the later components typically disappear
TDA_H1_count	TDA	<i>Number of H1 homology features (cycles)</i>	The larger this number the more cyclic structures the graph has
TDA_H1_total_persistence	TDA	<i>Total persistence of H1 features</i>	The larger this number the more persistent the cyclic structure is
TDA_H1_mean_persistence	TDA	<i>Mean persistence of H1 features</i>	The larger this number the more stable the cyclic structure is
TDA_H1_max_persistence	TDA	<i>Maximum persistence of H1 features</i>	The larger this number the more stable the most persistent cycle is
TDA_H1_persistence_entropy	TDA	<i>Entropy of H1 persistence distribution</i>	The larger this number the more diverse the cycle persistence values are
TDA_H1_mean_birth	TDA	<i>Mean birth time of H1 features</i>	The larger this number the later cycles typically appear

Feature Name	Group	Description	Interpretation
TDA_H1_mean_death	TDA	Mean death time of H1 features	The larger this number the later cycles typically disappear
TDA_Betti0_at_q25	TDA	Betti number β_0 at 25th percentile filtration	The larger this number the more components exist at low filtration levels
TDA_Betti0_at_q50	TDA	Betti number β_0 at 50th percentile filtration	The larger this number the more components exist at medium filtration levels
TDA_Betti0_at_q75	TDA	Betti number β_0 at 75th percentile filtration	The larger this number the more components exist at high filtration levels
TDA_Betti1_at_q25	TDA	Betti number β_1 at 25th percentile filtration	The larger this number the more cycles exist at low filtration levels
TDA_Betti1_at_q50	TDA	Betti number β_1 at 50th percentile filtration	The larger this number the more cycles exist at medium filtration levels
TDA_Betti1_at_q75	TDA	Betti number β_1 at 75th percentile filtration	The larger this number the more cycles exist at high filtration levels
Basic_avg_degree_norm	Basic_Normalized	Average degree normalized by graph size	The larger this number the more connected the graph is relative to its size
Basic_degree_entropy_norm	Basic_Normalized	Degree entropy normalized by maximum possible	The larger this number the more diverse the node degrees are relative to maximum diversity
Connectivity_diameter_norm	Connectivity_Normalized	Diameter normalized by graph size	The larger this number the more spread out the graph is relative to its size
Connectivity_radius_norm	Connectivity_Normalized	Radius normalized by graph size	The larger this number the more spread out the graph is relative to its size
Wiener_mean_distance	Connectivity_Normalized	Mean distance normalized by Wiener index	The larger this number the more spread out the graph is relative to total distance
Motif_triangles_per_Cn3	Motifs_3_4_Normalized	Triangles normalized by $C(n,3)$	The larger this number the more triangular the graph is relative to maximum possible
Motif_4_cycles_per_Cn4	Motifs_3_4_Normalized	4-cycles normalized by $C(n,4)$	The larger this number the more square-like the graph is relative to maximum possible
Motif_4_cliques_per_Cn4	Motifs_3_4_Normalized	4-cliques normalized by $C(n,4)$	The larger this number the more tightly connected 4-node groups are relative to maximum possible
Motif_wedges_per_max	Motifs_3_4_Normalized	Wedges normalized by theoretical maximum	The larger this number the more path-like the graph is relative to maximum possible
Motif_induced_K1_3_per_Cn4	Motifs_3_4_Normalized	$K_{1,3}$ normalized by $C(n,4)$	The larger this number the more star-like the graph is relative to maximum possible
Motif_induced_P4_per_Cn4	Motifs_3_4_Normalized	P_4 normalized by $C(n,4)$	The larger this number the more path-like the graph is relative to maximum possible
Motif_induced_C4_per_Cn4	Motifs_3_4_Normalized	C_4 normalized by $C(n,4)$	The larger this number the more cycle-like the graph is relative to maximum possible
Motif_induced_TailedTriangle_per_Cn4	Motifs_3_4_Normalized	Tailed triangle normalized by $C(n,4)$	The larger this number the more tailed triangle structures are relative to maximum possible

Feature Name	Group	Description	Interpretation
Motif.induced.Diamond.per.Chitifs.3,4.Normalized		Diamond normalized by $C(n,4)$	The larger this number the more diamond structures are relative to maximum possible
Motif.induced.K4.per.Cn4	Motifs.3,4.Normalized	K_4 normalized by $C(n,4)$	The larger this number the more tightly connected 4-node groups are relative to maximum possible
Robust.articulation.points.perNodeNormalized		Articulation points per node	The larger this number the more vulnerable the graph is to fragmentation per node
Robust.bridge.count.per.edge	Robustness.Normalized	Bridges per edge	The larger this number the more vulnerable the graph is to fragmentation per edge
Connectivity.num.components(penalty).Normalized		Components per node	The larger this number the more fragmented the graph is per node
Centrality.closeness_mean_normalized		Mean closeness normalized by maximum	The larger this number the more centrally located nodes are on average relative to maximum
Centrality.closeness_max_normalized		Max closeness normalized by maximum	The larger this number the more centrally located the most central node is relative to maximum
Spectral.algebraic.connectivitySpectralNormalized		Algebraic connectivity over average degree	The larger this number the more connected the graph is relative to its average connectivity
Spectral.spectral_gap_rel	Spectral.Normalized	Relative spectral gap	The larger this number the more well-connected the graph is relative to its connectivity
Spectral.laplacian_heat_trace.t0Normalized		Heat trace $t=0.1$ per node	The larger this number the more heat spreads quickly per node
Spectral.laplacian_heat_trace.t1Normalized		Heat trace $t=1.0$ per node	The larger this number the more heat spreads per node
Spectral.laplacian_heat_trace.t5Normalized		Heat trace $t=5.0$ per node	The larger this number the more heat spreads per node
Adjacency.energy_per_node	Spectral.Normalized	Adjacency energy per node	The larger this number the more energetic/vibrant the graph is per node
Adjacency.energy_over_fro	Spectral.Normalized	Adjacency energy over Frobenius norm	The larger this number the more energetic the graph is relative to its total energy
Adjacency.estrada_per_node	Spectral.Normalized	Estrada index per node	The larger this number the more communicable the graph is per node
log_Adjacency.estrada_per_node	Spectral.Normalized	Log Estrada index per node	The larger this number the more communicable the graph is per node (log scale)
Adjacency.moment_2_over_avgDegree	Spectral.Normalized	Second moment over average degree	The larger this number the more spread out the adjacency spectrum is relative to average connectivity
Adjacency.moment_3_over_avgDegree	Spectral.Normalized	Third moment over average degree cubed	The larger this number the more high-frequency components are relative to connectivity cubed
Adjacency.moment_4_over_avgDegree	Spectral.Normalized	Fourth moment over average degree to fourth	The larger this number the more peaked the adjacency spectrum is relative to connectivity to fourth power
Planarity.num.faces_over_upperBound		Faces over theoretical upper bound	The larger this number the more complex the planar structure is relative to maximum possible

Feature Name	Group	Description	Interpretation
<code>Planarity.face_size.mean.norm</code>	<code>Planarity.Normalized</code>	<i>Mean face size normalized</i>	The larger this number the larger the typical face is relative to maximum possible
<code>Symmetry.aut.size.log.over.log</code>	<code>Symmetry.Normalized</code>	<i>Log automorphism size over log n!</i>	The larger this number the more symmetric the graph is relative to maximum possible symmetry
<code>Symmetry.num.orbits.per.node</code>	<code>Symmetry.Normalized</code>	<i>Orbits per node</i>	The larger this number the more diverse the node roles are per node
<code>Symmetry.orbit.size.max.per.node</code>	<code>Symmetry.Normalized</code>	<i>Max orbit size per node</i>	The larger this number the more nodes share the same role per node
<code>TDA.H0.count.per.node</code>	<code>TDA.Normalized</code>	<i>H0 features per node</i>	The larger this number the more disconnected components exist per node
<code>TDA.H0_total.persistence.over.diam</code>	<code>TDA.Normalized</code>	<i>H0 persistence over diameter</i>	The larger this number the more persistent the connectivity structure is relative to graph spread
<code>TDA.H0_mean.persistence.over.diam</code>	<code>TDA.Normalized</code>	<i>H0 mean persistence over diameter</i>	The larger this number the more stable the connectivity structure is relative to graph spread
<code>TDA.H0_max.persistence.over.diam</code>	<code>TDA.Normalized</code>	<i>H0 max persistence over diameter</i>	The larger this number the more stable the most persistent component is relative to graph spread
<code>TDA.H0_mean_birth_over_diam</code>	<code>TDA.Normalized</code>	<i>H0 mean birth over diameter</i>	The larger this number the later components typically appear relative to graph spread
<code>TDA.H0_mean_death_over_diam</code>	<code>TDA.Normalized</code>	<i>H0 mean death over diameter</i>	The larger this number the later components typically disappear relative to graph spread
<code>TDA.H1_count.per.node</code>	<code>TDA.Normalized</code>	<i>H1 features per node</i>	The larger this number the more cyclic structures exist per node
<code>TDA.H1_total.persistence.over.diam</code>	<code>TDA.Normalized</code>	<i>H1 persistence over diameter</i>	The larger this number the more persistent the cyclic structure is relative to graph spread
<code>TDA.H1_mean.persistence.over.diam</code>	<code>TDA.Normalized</code>	<i>H1 mean persistence over diameter</i>	The larger this number the more stable the cyclic structure is relative to graph spread
<code>TDA.H1_max.persistence.over.diam</code>	<code>TDA.Normalized</code>	<i>H1 max persistence over diameter</i>	The larger this number the more stable the most persistent cycle is relative to graph spread
<code>TDA.H1_mean_birth_over_diam</code>	<code>TDA.Normalized</code>	<i>H1 mean birth over diameter</i>	The larger this number the later cycles typically appear relative to graph spread
<code>TDA.H1_mean_death_over_diam</code>	<code>TDA.Normalized</code>	<i>H1 mean death over diameter</i>	The larger this number the later cycles typically disappear relative to graph spread
<code>TDA.Betti0_at.q25.per.node</code>	<code>TDA.Normalized</code>	<i>Betti0 at q25 per node</i>	The larger this number the more components exist at low filtration levels per node
<code>TDA.Betti1_at.q25.per.node</code>	<code>TDA.Normalized</code>	<i>Betti1 at q25 per node</i>	The larger this number the more cycles exist at low filtration levels per node
<code>TDA.Betti0_at.q50.per.node</code>	<code>TDA.Normalized</code>	<i>Betti0 at q50 per node</i>	The larger this number the more components exist at medium filtration levels per node
<code>TDA.Betti1_at.q50.per.node</code>	<code>TDA.Normalized</code>	<i>Betti1 at q50 per node</i>	The larger this number the more cycles exist at medium filtration levels per node

Feature Name	Group	Description	Interpretation
TDA_Betti0_at_q75_per_node	TDA_Normalized	Betti0 at q75 per node	The larger this number the more components exist at high filtration levels per node
TDA_Betti1_at_q75_per_node	TDA_Normalized	Betti1 at q75 per node	The larger this number the more cycles exist at high filtration levels per node
Motif_induced_g_1_4	Motifs_4	Number of induced Path4 (P_4) subgraphs	The larger this number the more path-like 4-node structures the graph has
Motif_induced_g_2_4	Motifs_4	Number of induced Star4 ($K_{1,3}$) subgraphs	The larger this number the more star-like 4-node structures the graph has
Motif_induced_g_3_4	Motifs_4	Number of induced Cycle4 (C_4) subgraphs	The larger this number the more cycle-like 4-node structures the graph has
Motif_induced_g_4_4	Motifs_4	Number of induced TailedTriangle subgraphs	The larger this number the more tailed triangle 4-node structures the graph has
Motif_induced_g_5_4	Motifs_4	Number of induced Diamond subgraphs	The larger this number the more diamond 4-node structures the graph has
Motif_induced_g_6_4	Motifs_4	Number of induced Clique4 (K_4) subgraphs	The larger this number the more tightly connected 4-node groups the graph has
Motif_induced_g_1_4_per_Cn4	Motifs_4_Normalized	Path4 normalized by $C(n,4)$	The larger this number the more path-like 4-node structures are relative to maximum possible
Motif_induced_g_2_4_per_Cn4	Motifs_4_Normalized	Star4 normalized by $C(n,4)$	The larger this number the more star-like 4-node structures are relative to maximum possible
Motif_induced_g_3_4_per_Cn4	Motifs_4_Normalized	Cycle4 normalized by $C(n,4)$	The larger this number the more cycle-like 4-node structures are relative to maximum possible
Motif_induced_g_4_4_per_Cn4	Motifs_4_Normalized	TailedTriangle normalized by $C(n,4)$	The larger this number the more tailed triangle 4-node structures are relative to maximum possible
Motif_induced_g_5_4_per_Cn4	Motifs_4_Normalized	Diamond normalized by $C(n,4)$	The larger this number the more diamond 4-node structures are relative to maximum possible
Motif_induced_g_6_4_per_Cn4	Motifs_4_Normalized	Clique4 normalized by $C(n,4)$	The larger this number the more tightly connected 4-node groups are relative to maximum possible
Motif_induced5_g_0_5_per_Cn5	Motifs_5_Normalized	5-node graphlet g_0 normalized by $C(n,5)$	The larger this number the more g_0 5-node structures are relative to maximum possible
Motif_induced5_g_1_5_per_Cn5	Motifs_5_Normalized	5-node graphlet g_1 normalized by $C(n,5)$	The larger this number the more g_1 5-node structures are relative to maximum possible
Motif_induced5_g_2_5_per_Cn5	Motifs_5_Normalized	5-node graphlet g_2 normalized by $C(n,5)$	The larger this number the more g_2 5-node structures are relative to maximum possible
Motif_induced5_g_3_5_per_Cn5	Motifs_5_Normalized	5-node graphlet g_3 normalized by $C(n,5)$	The larger this number the more g_3 5-node structures are relative to maximum possible
Motif_induced5_g_4_5_per_Cn5	Motifs_5_Normalized	5-node graphlet g_4 normalized by $C(n,5)$	The larger this number the more g_4 5-node structures are relative to maximum possible
Motif_induced5_g_5_5_per_Cn5	Motifs_5_Normalized	5-node graphlet g_5 normalized by $C(n,5)$	The larger this number the more g_5 5-node structures are relative to maximum possible
Motif_induced5_g_6_5_per_Cn5	Motifs_5_Normalized	5-node graphlet g_6 normalized by $C(n,5)$	The larger this number the more g_6 5-node structures are relative to maximum possible

Feature Name	Group	Description	Interpretation
Motif_induced5_g_7_5_per_Cn5	Motifs_5_Normalized	5-node graphlet $g_{\cdot 7}$ normalized by $C(n,5)$	The larger this number the more g_7 5-node structures are relative to maximum possible
Motif_induced5_g_8_5_per_Cn5	Motifs_5_Normalized	5-node graphlet $g_{\cdot 8}$ normalized by $C(n,5)$	The larger this number the more g_8 5-node structures are relative to maximum possible
Motif_induced5_g_9_5_per_Cn5	Motifs_5_Normalized	5-node graphlet $g_{\cdot 9}$ normalized by $C(n,5)$	The larger this number the more g_9 5-node structures are relative to maximum possible
Motif_induced5_g_10_5_per_Cn5	Motifs_5_Normalized	5-node graphlet $g_{\cdot 10}$ normalized by $C(n,5)$	The larger this number the more g_10 5-node structures are relative to maximum possible
Motif_induced5_g_11_5_per_Cn5	Motifs_5_Normalized	5-node graphlet $g_{\cdot 11}$ normalized by $C(n,5)$	The larger this number the more g_11 5-node structures are relative to maximum possible
Motif_induced5_g_12_5_per_Cn5	Motifs_5_Normalized	5-node graphlet $g_{\cdot 12}$ normalized by $C(n,5)$	The larger this number the more g_12 5-node structures are relative to maximum possible
Motif_induced5_g_13_5_per_Cn5	Motifs_5_Normalized	5-node graphlet $g_{\cdot 13}$ normalized by $C(n,5)$	The larger this number the more g_13 5-node structures are relative to maximum possible
Motif_induced5_g_14_5_per_Cn5	Motifs_5_Normalized	5-node graphlet $g_{\cdot 14}$ normalized by $C(n,5)$	The larger this number the more g_14 5-node structures are relative to maximum possible
Motif_induced5_g_15_5_per_Cn5	Motifs_5_Normalized	5-node graphlet $g_{\cdot 15}$ normalized by $C(n,5)$	The larger this number the more g_15 5-node structures are relative to maximum possible
Motif_induced5_g_16_5_per_Cn5	Motifs_5_Normalized	5-node graphlet $g_{\cdot 16}$ normalized by $C(n,5)$	The larger this number the more g_16 5-node structures are relative to maximum possible
Motif_induced5_g_17_5_per_Cn5	Motifs_5_Normalized	5-node graphlet $g_{\cdot 17}$ normalized by $C(n,5)$	The larger this number the more g_17 5-node structures are relative to maximum possible
Motif_induced5_g_18_5_per_Cn5	Motifs_5_Normalized	5-node graphlet $g_{\cdot 18}$ normalized by $C(n,5)$	The larger this number the more g_18 5-node structures are relative to maximum possible
Motif_induced5_g_20_5_per_Cn5	Motifs_5_Normalized	5-node graphlet $g_{\cdot 20}$ normalized by $C(n,5)$	The larger this number the more g_20 5-node structures are relative to maximum possible
Motif_5_cycles_per_Cn5	Motifs_5_Normalized	5-cycles normalized by $C(n,5)$	The larger this number the more 5-sided cycle structures are relative to maximum possible
Motif_5_cliques_per_Cn5	Motifs_5_Normalized	5-cliques normalized by $C(n,5)$	The larger this number the more tightly connected 5-node groups are relative to maximum possible
Motif_5_cycles_per_Kn	Motifs_5_Normalized	5-cycles normalized by complete graph	The larger this number the more 5-sided cycle structures are relative to complete graph
Spectral_kirchhoff_index	Spectral_Laplacian	Kirchhoff index (alternative name)	The larger this number the more spread out the graph is
Spectral_laplacian_heat_trace_t0	Spectral_Laplacian	Laplacian heat trace at $t=0.5$	The larger this number the more heat spreads through the graph
Spectral_laplacian_heat_trace_t2	Spectral_Laplacian	Laplacian heat trace at $t=2.0$	The larger this number the more heat spreads through the graph
Spectral_adjacency_energy	Spectral_Adjacency	Adjacency energy (alternative name)	The larger this number the more energetic/vibrant the graph is

Feature Name	Group	Description	Interpretation
Spectral_adjacency_estrada_index	Spectral_Adjacency	Adjacency Estrada index (alternative name)	The larger this number the more communicable the graph is
Spectral_adjacency_moment_2	Spectral_Adjacency	Adjacency second moment (alternative name)	The larger this number the more spread out the adjacency spectrum is
Spectral_adjacency_moment_3	Spectral_Adjacency	Adjacency third moment (alternative name)	Positive values mean more high-frequency components; negative means more low-frequency components
Spectral_adjacency_moment_4	Spectral_Adjacency	Adjacency fourth moment (alternative name)	The larger this number the more peaked the adjacency spectrum is
